what we'll talk about

NEW!
IMPROVED!

Extreme couch potatoes,
sit up and take note!

The world's greatest invention
becomes even better

ONE remote

... and this one works

great throws of remote control history

May 18, 1972

Joe B., Smithfield, Va., heaves remote through window

damages: \$635,729

lawsuit: man lacerated by flying glass while walking dog.

December 26, 1988

Alfonse S., Mars, Pa., annihilates universal remote

action: jumps up and down on it, yelling, "Die, die, die!"

damages: \$5,793.19 (Christmas tree knocked over in chaos)

lawsuit: wife filed for divorce

great throws of remote control history

July 4, 2003

Ralph D., Lilydale, N.Y., killed by remote

action: beaten to death by wife when he clicked once too often

quote: "I warned him."

outcome: wife found not guilty by jury of 12 women

October 11, 2007

Donald C., Winter, Vt., electrocutes dog by remote control

quote: "It wasn't good for anything except a Frisbee, but I sure miss ol' Mongoose."

informal survey responses

On a typical day:

88% of respondents used 1-4 remotes

60% found themselves picking up the wrong remote

56% needed to look at the remote to use it

52% rated themselves as competent at using and understanding technology

44% of respondents had a family member with vision problems

14% of respondents had a family member with hearing problems

52% were highly interested in the Zen remote

informal survey responses

Describe your ideal remote

- voice activated: "TV, change to channel 11"
- tactile identification of buttons
- large keys
- lighted keys
- signals location if lost
- truly universal; can sync with everything

our mission

transform the remote

"too" problems

too many tiny, similar buttons

too many remotes in one house

too difficult to tell apart

too difficult to program

too difficult to find

our solution

a remote that will

program from RFID chips in electronic devices

work on all remote-controlled appliances

be usable by

- people with low vision
- people with hearing problems
- people with arthritis or other motor problems
- children or senior citizens

be easy to find if lost

activity breakdown

looking: time spent studying at remote before action

pressing: time spent setting up and activating command

watching: time spent looking at television screen

situating: time spent getting ready to use remote

scenarios of current and transformed use

current

- locating the remote
- looking at the remote
- finding buttons
- pressing buttons

transformed

- standardized location
- tactile feedback
- better labeling
- minimize number

observations

4 people, 30 seconds each

Observations 1-2

- made at kitchen TV
- timed using stopwatch
- no interference

Observations 3-4

- made at living room TV
- tasks: find remote, go to channel, watch, change channels/devices, turn off TV
- no interference

sample observation

tasks

find remote

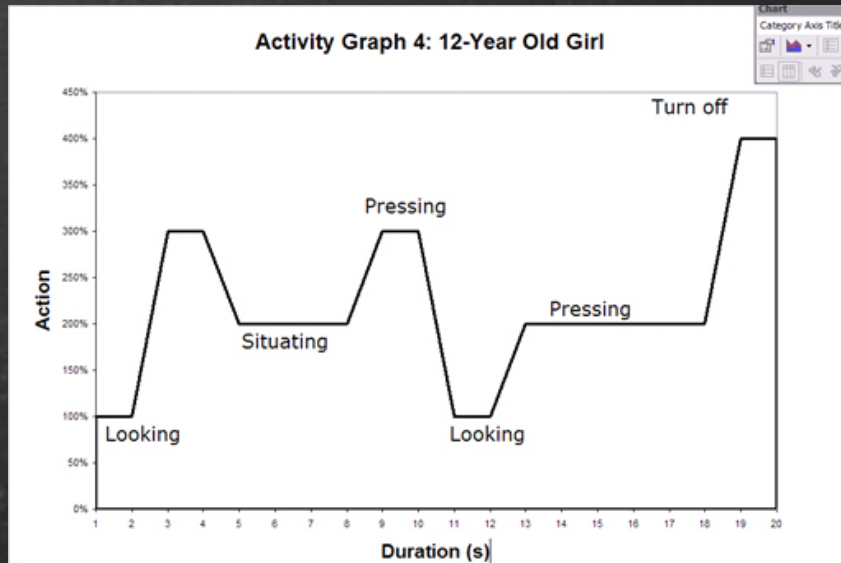

turn on television

change channel/device

turn off remote

replace remote

activity graphs

Activity Graph 3: 11-Year Old Male

requirements

The people we observed

- spent most of their time looking at the remote
 - had to look down to find numbers
 - had to look down to find specific buttons
- had a minimal amount of trouble targeting buttons
 - we did not test significantly older users
 - we did not test less tech-savvy users

What the Zen will do

- use RFID technology to solve programming problems
- use tactile feedback to minimize looking at remote
- have clear labeling to minimize confusion
- have a minimal amount of buttons

impact

Baby Boom generation (1946-1964)

78 million people with potential for age-related problems

arthritis

degenerating vision

degenerating hearing

mobility problems

anyone with similar problems

transformation

electronics -- devices less formidable to the tech naive
more intuitive to use

people -- reducing frustration
making technology doable for less tech-savvy
